What?			
When? Why?	Lesson 1 Learning Intentions	Lesson 2 Learning Intentions	Lesson 3 Learning Intentions
1	Introduction to experimental psychology and psychology as a science.	Introduction to writing hypothesis.	Introduction to writing hypothesis.
	Students will be able to define key research method terms such as; control, hypotheses and variables (IV, DV, EV). The concept of reliability will be introduced.	Students will be able to identify the difference between a directional and non-directional hypothesis and write their own using operationalised variables.	Students will be able to identify the difference between an experimental hypothesis and a null hypothesis, including writing their own null- hypothesis.
2	The foetal brain.	The foetal brain 2.	The foetal brain 3.
	Students to understand the stages of brain development and the associated functions including the development of the hemispheres.	Students to understand the role and function of the forebrain, mid-brain and hind-brain.	Students will be able to outline and identify the different lobes and areas of the forebrain.
3	Piaget's theory of cognitive development.	Piaget's theory of cognitive development 2.	Piaget's theory of cognitive development 3.
	Students to understand the four stages of cognitive development according to Piaget and the behaviours associated with each.	Students to understand the factors that enable a child to successfully pass through the stages of cognitive development.	Students must be able to explain what is meant by a schema, how schemas develop and how schemas influence a child's cognitive development.
4	Piaget's Three Mountains study.	Experiments.	Experiments 2.
	Students must be able to explain how Piaget conducted his study to demonstrate cognitive development, including the age in which a child develops decentration.	Students will learn about the features of a laboratory, field and natural experiment (with explicit reference to variables).	Students will learn about some strengths and limitations of each experiment type with an explicit reference to reliability.
5	Evaluating Piaget's Three Mountains study.	Evaluating Piaget's Three Mountains study 2.	Mindset Theory.
	Students will apply their knowledge of experiments to Piaget and start to evaluate the study's methodology.	Students will be able to outline the replications of Piaget's study and explain how the findings challenge Piaget's original theory. Students will be able to explain the importance of replication for theory construction.	Students must be able to explain the concept of Mindset theory and the difference between an incremental mindset and a fixed mindset.

6	Mindset Theory 2.	Observational Methods.	Observational Methods 2.
	Students will consider the strengths and limitations of Dweck's Mindset theory, including applications and limitations relating to reductionism.	Students must be able to explain the difference between a natural and controlled observation, including overt and covert.	Students will be able to identify strengths and limitations with the different types of observational research carried out, offering potential solutions to the problems they identify. (Links to the concept of Reliability and Validity)
7	Gunderson's Observational Study.	Gunderson's Observational Study 2.	Design your own observational study.
	Students to be able to outline how Gunderson conducted her research and how her findings both support and challenge Dweck's Mindset theory. Students will be able to explain what is meant by a longitudinal study and why this is important in this context.	Students will be able to identify strengths and limitations of Gunderson's observational study, linking specifically to the issue of validity.	Students will be able to design their own observational research to be conducted around school to analyse the type of Mindsets being promoted through teacher praise. Students must be explicit when justifying their choice with reference to validity and reliability.
